Project Analysis and Explanation

This project focuses on improving the user interface and user experience of a college website based on **Human–Computer Interaction (HCI)** principles.

The old website design had many usability problems. The layout was not clear, colors were not consistent, and some content was hard to read or hidden. Important pages were missing, and users had to click many times to find information. This caused confusion and poor user experience.

In the new design, the website was redesigned to be clearer**, simple, and user-friendly**. Content is well organized into clear sections, colors are consistent, and text is easy to read. New pages such as **Contact Us** and **Student Services** were redesigned to help users find information quickly.

Overall, the new design improves usability, accessibility, and user satisfaction. The project shows how applying HCI principles can make a website easier to use and more effective for users.
